

Two-dimensional verdict reading of the cylinder-flow pilots

Verdict regions

- pass ($V < \text{tol.}$, In-domain)
- SUT inconsistency ($V \geq \text{tol.}$, In-domain)
- OOD-stress / out-of-domain (Out / Boundary)

Pilots (medians from real ledgers)

- P1: Node-perm.\ equivariance structurally exact ($V \equiv 0$)
- P2: Conservation (ref.-relative) ratio = 1.003, within tol.\ budget
- P3: Mirror-y on symmetric mesh $V = 1.10$, $\text{tol} = 10^{-6}$
- P4: Mirror-y OOD-stress (downgraded) $V/\text{floor} = 3.96$ (floor as eff.\ tol.)
- P5: Conservation (absolute, deferred) admissibility predicate fails: $\text{tol.} \leq \text{operator floor}$ (off-plane: not admitted to verdict space)
